## **Data management across the Europe**

The EUDAT project overview

# Agenda

## Bulk data transfer

Basic concepts, tools and techniques

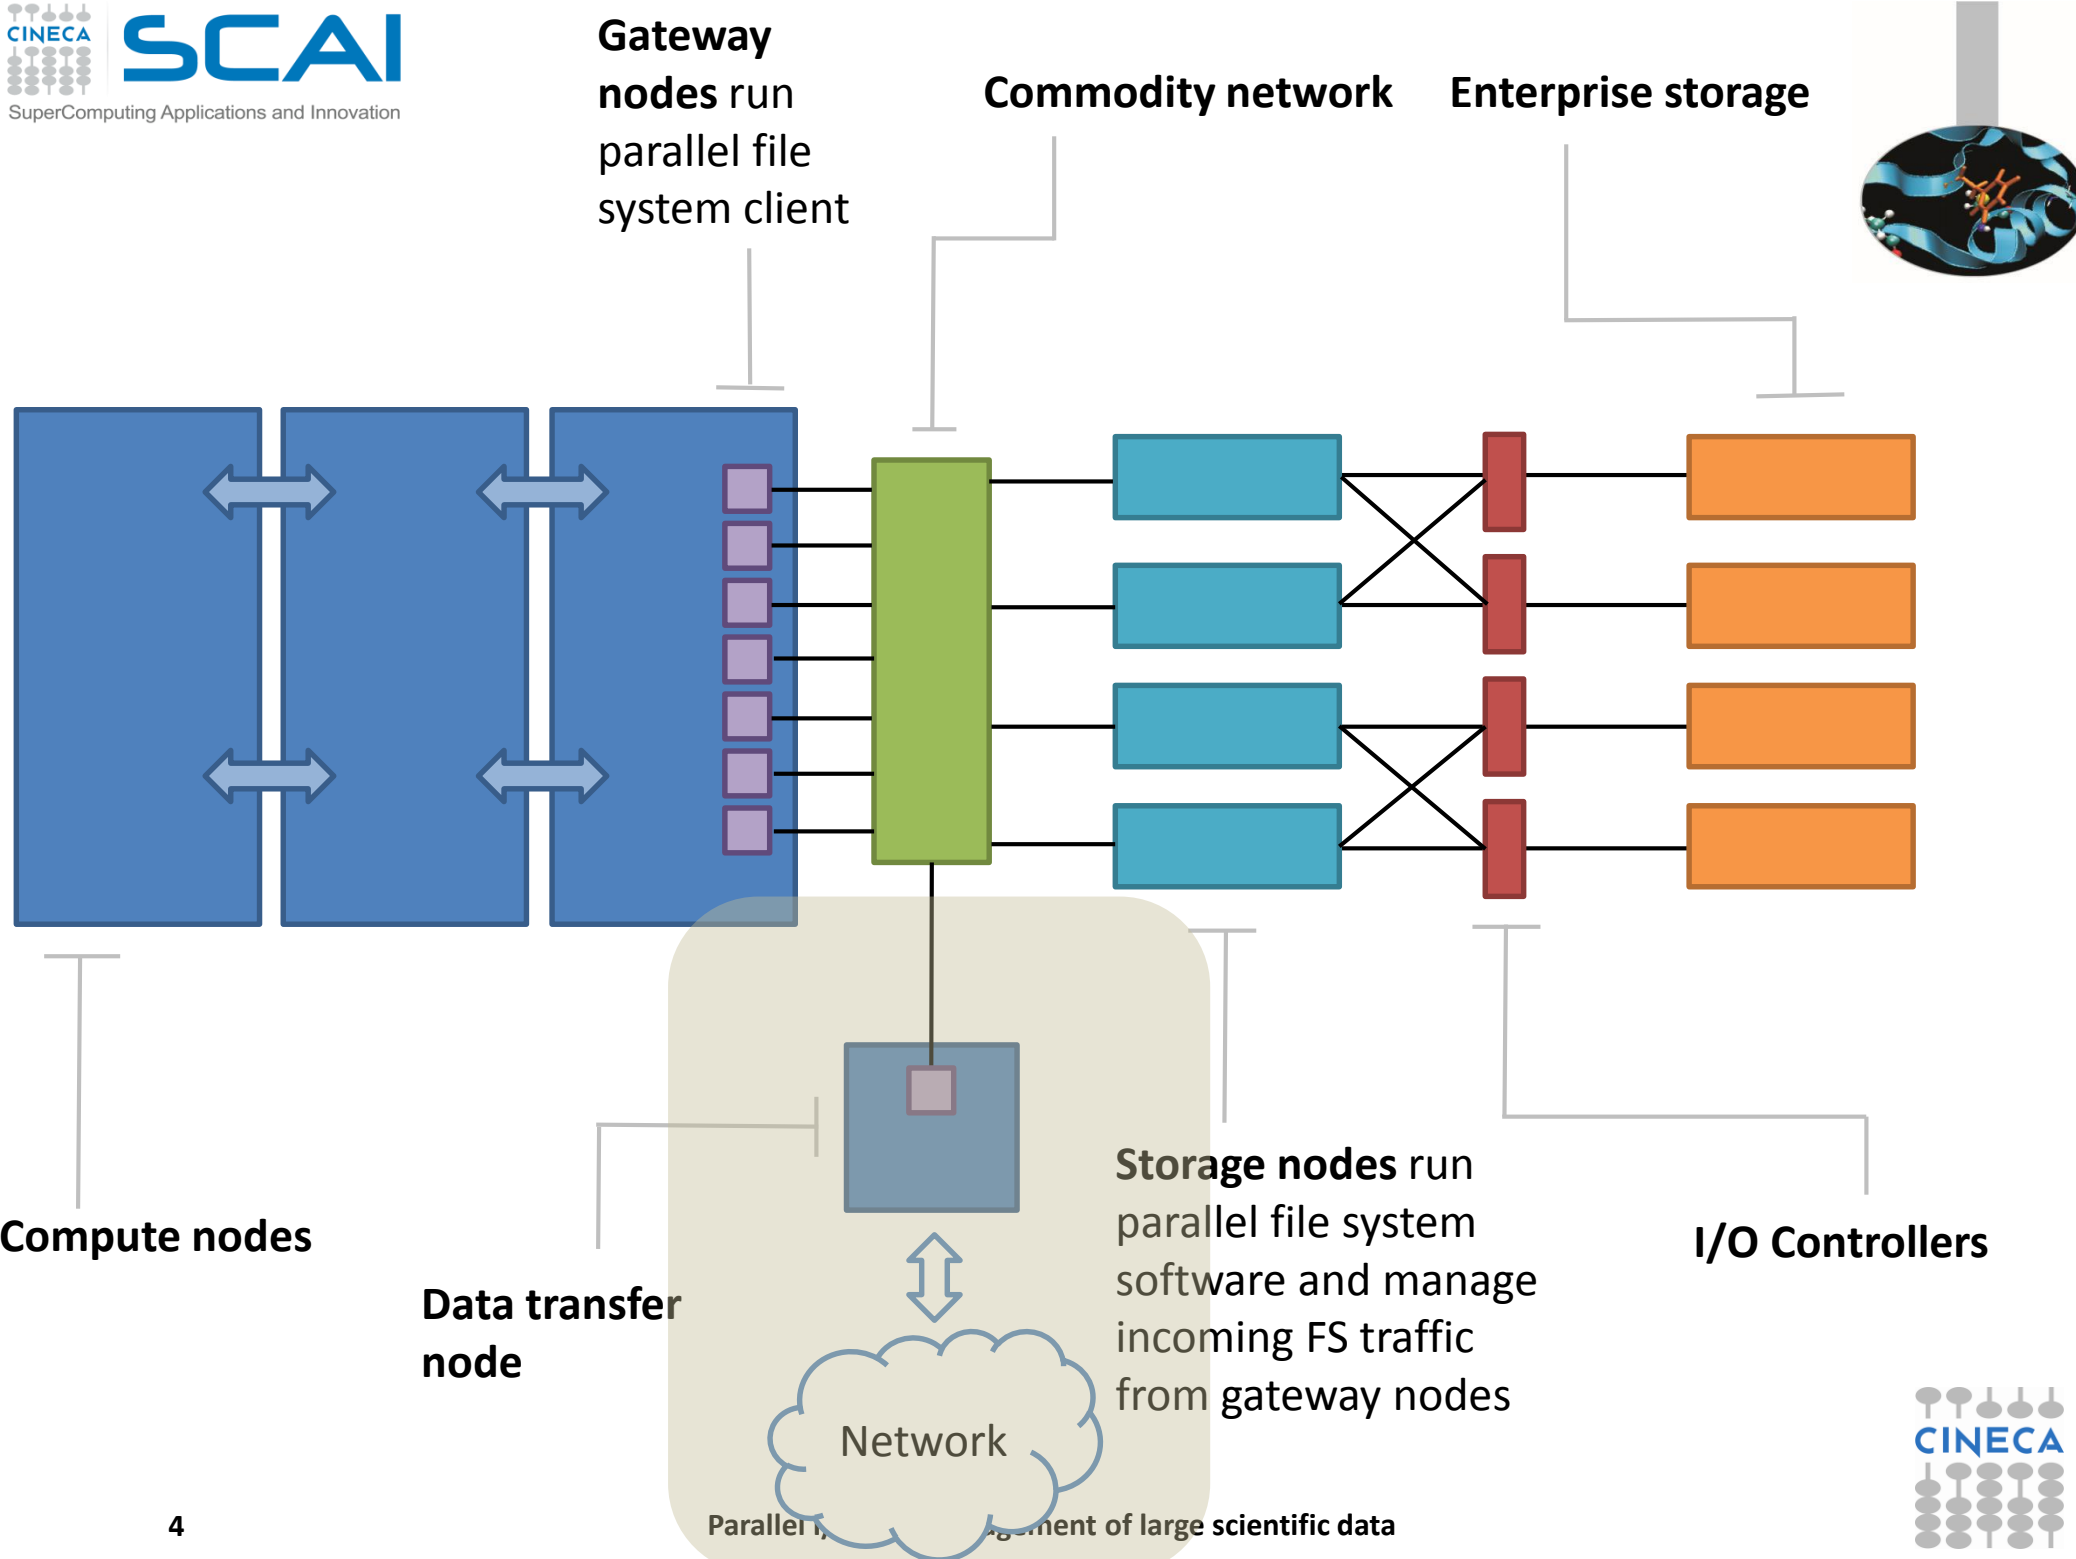

*Bulk data transfer is a software application feature that uses data **compression**, **data blocking** and **buffering** to optimize transfer rates when moving large data files*

## Data post-processing

Remote visualization

## Data management across the Europe

The EUDAT project overview

# Bulk data movement

- **The problem**
- **Involved components**
  - Network architecture
  - Dedicated hosts
  - Software tools

PHOTO: DAVIES & STARR

# Bulk Data Movement

- Common task at all data scales
- Driven by collaboration, distributed resources
  - Computing centers
  - Facilities
  - Major instruments (e.g. LHC)
- Fundamental to the conduct of science (scientific productivity follows data locality)
- Data sets of 200GB to 5TB are now common
- Often a difficult task for various reasons
- Storage capacity grows faster with respect to Public Network bandwidth

## Time to copy 1TB

- **10 Mb/s network:** 300 hrs (12.5 days)
- **100 Mb/s network:** 30 hrs
- **1 Gb/s network:** 3 hrs (are your disks fast enough?)
- **10 Gb/s network:** 20 minutes (need *really fast disks and file system*)
- **Compare these speeds to:**
  - USB 2.0 portable disk
    - 60 MB/sec (480 Mbps) peak
    - 20 MB/sec (160 Mbps) reported on line
    - 15-40 hours to load 1 Terabyte

# Data Throughput – Transfer Times

Bandwidth Requirements to move Y Bytes of data in Time X

Bits per Second Requirements

<b>10PB</b>	25,020.0 Gbps	3,127.5 Gbps	1,042.5 Gbps	148.9 Gbps	34.7 Gbps
<b>1PB</b>	2,502.0 Gbps	312.7 Gbps	104.2 Gbps	14.9 Gbps	3.5 Gbps

# Bulk data movement

- The problem
- Involved components
  - **Network architecture**
  - Dedicated hosts
  - Software tools

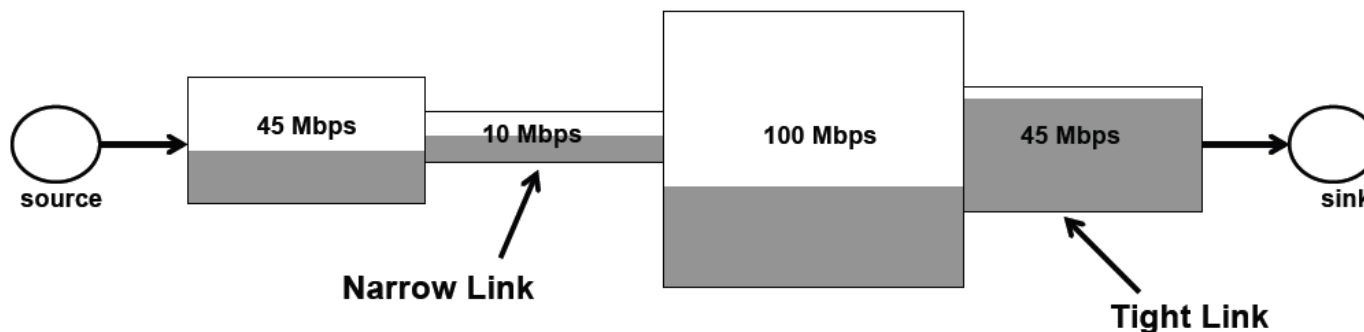

PHOTO: DAVIES & STARR

# Terminology

The term “Network Throughput” is vague and should be avoided

- **Capacity:** link speed
  - **Narrow Link:** link with the lowest capacity along a path
  - Capacity of the end-to-end path = capacity of the narrow link
- **Utilized bandwidth:** current traffic load
- **Available bandwidth:** capacity – utilized bandwidth
  - **Tight Link:** link with the least available bandwidth in a path
- **Achievable bandwidth:** includes protocol and host issues

## Network architecture

- Most LANs are not purpose-built for science traffic they carry many types of traffic
  - Desktop machines, laptops, wireless
  - VOIP
  - HVAC control systems
  - Financial systems, HR
  - *Some science data coming from someplace*
- Bulk data transfer traffic is typically very different than enterprise traffic

# Bulk data movement

- The problem
- Involved components
  - Network architecture
  - **Dedicated hosts**
  - Software tools

# Data transfer nodes

- **Reasons for dedicated hosts**
  - One thing to test and tune
  - One place for large WAN flows to go (it's easier to give one host a special configuration than to do this for all workstations)
  - One set of firewall exceptions

The diagram illustrates a network architecture for the SDN-based network at the University of Tennessee. It features a central **Science Core Switch/Routers** connected to various components:

- WAN**: Connected to the **Site Border Router** via **10GE IP** and **10GE SDN** links. A red arrow labeled **WAN Traffic** points from the WAN towards the **10G GridFTP Server**.
- Site Border Router**: A router that connects the WAN to the internal network.
- perfsONAR**: A server connected to the **Site Border Router** via a **10GE** link.
- Cluster**: A group of servers connected to the **Science Core Switch/Routers** via **10GE** links.
- Supercomputer**: A large system connected to the **Science Core Switch/Routers** via an **Nx10GE** link.
- Parallel Filesystem**: A storage system connected to the **Science Core Switch/Routers** via an **Nx10GE** link.
- 10G GridFTP Server**: A server connected to the **Science Core Switch/Routers** via a **10GE** link. A red arrow labeled **LAN Traffic** points from the **10G GridFTP Server** towards the **Science Core Switch/Routers**.
- perfsONAR**: A server connected to the **Science Core Switch/Routers** via a **10GE** link.

The diagram also shows internal connections between the **Science Core Switch/Routers** and the **10G GridFTP Server** via **10GE** links, and between the **Science Core Switch/Routers** and the **10G GridFTP Server** via **10GE** links.

## Host tuning - TCP

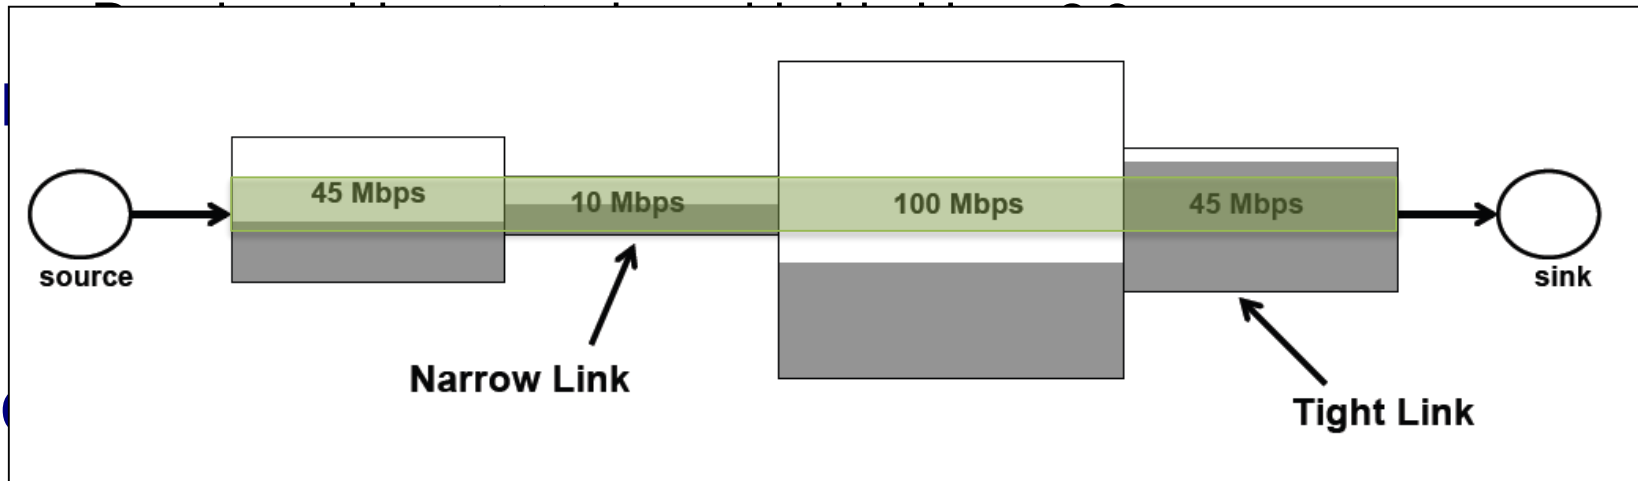

- TCP tuning commonly refers to the proper configuration of buffers that correspond to TCP windowing
- Historically TCP tuning parameters were host-global, with exceptions configured per-socket by applications
  - Applications had to understand the network in detail, and know how far away clients were
  - Some applications did this – most did not
- Solution: auto-tune TCP connections within preconfigured limits

# Buffer autotuning

- To solve the buffer tuning problem, Linux OS added TCP Buffer autotuning
  - Sender-side TCP buffer autotuning introduced in Linux 2.4

- - Linux 2.6: 256K to 4MB, depending on distribution
  - FreeBSD 7: 256K
  - Windows 7: 16M
  - Mac OSX 10.5: 8M
- Some defaults are still wrong!

# Autotuning settings (Max 16MB)

- **Linux 2.6**

```
net.core.rmem_max = 16777216
net.core.wmem_max = 16777216
# autotuning min, default, and max number of bytes to
  use
net.ipv4.tcp_rmem = 4096 87380 16777216
net.ipv4.tcp_wmem = 4096 65536 16777216
```

- **FreeBSD 7.0**

```
net.inet.tcp.sendbuf_auto=1
net.inet.tcp.recvbuf_auto=1
net.inet.tcp.sendbuf_max=16777216
net.inet.tcp.recvbuf_max=16777216
```

- **OSX 10.5 (“Self-Tuning TCP”)**

```
kern.ipc.maxsockbuf=16777216
```

# Congestion control

- TCP senses network congestion by detecting packet loss
- Historically (TCP Reno) TCP used AIMD (Additive Increase, Multiplicative Decrease) for window sizing in response to loss
- After loss, window opens back up very slowly
  - causes very poor performance
- Newer algorithms, available in Linux, offer higher performance than Reno
  - Cubic (now the default in several Linux distributions)
  - HTCP (Hamilton)

# Bulk data movement

- The problem
- Involved components
  - Network architecture
  - Dedicated hosts
  - **Software tools**

# Data transfer tools

- **Parallelism is key**

- It is much easier to achieve a given performance level with four parallel connections than one connection
- Several tools offer parallel transfers

- **Latency interaction is critical**

- Wide area data transfers have much higher latency than LAN transfers
- Many tools and protocols assume a LAN
- Examples: SCP/SFTP, HPSS mover protocol

# Parallel Streams Help With TCP Congestion Control Recovery Time

## Sample data transfer rate

Using the right tool is very important

- **SCP/SFTP: 10 Mb/s**
  - standard Unix file copy tools
  - fixed 1 MB TCP window in OpenSSH
    - only 64 KB in OpenSSH versions < 4.7
- **FTP: 400-500 Mb/s**
  - assumes TCP buffer autotuning
  - Parallel stream FTP: 800-900 Mbps

# Why Not Use SCP or SFTP?

- **Pros:**

- Most scientific systems are accessed via OpenSSH
- SCP/SFTP are therefore installed by default
- Modern CPUs encrypt and decrypt well enough for small to medium scale transfers
- Credentials for system access and credentials for data transfer are the same

- **Cons:**

- The protocol used by SCP/SFTP has a fundamental flaw that limits WAN performance
- CPU speed doesn't matter – latency matters
- Fixed-size buffers reduce performance as latency increases
- It doesn't matter how easy it is to use SCP and SFTP – they simply do not perform

- **Verdict: Do Not Use Without Performance Patches**

# Why Not Use SCP or SFTP?

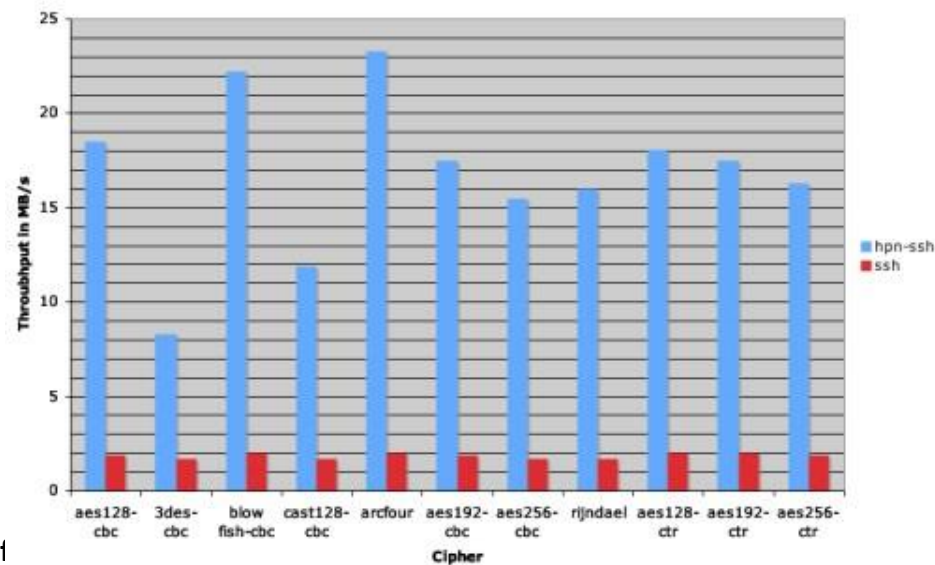

- PSC has a patch set that fixes problems with SSH
  - <http://www.psc.edu/networking/projects/hpnssh/>
- Significant performance Increase
- Advantage – this helps rsync too

BDP versus SSH Receive Window for a 100Mbps Path

Throughput Speeds of HPN-SSH Versus SSH

# What's about SFTP?

- Uses same code as SCP, so don't use SFTP for WAN transfers unless you have installed the HPN patch from PSC
- But even with the patch, SFTP has yet another flow control mechanism
  - By default, SFTP limits the total number of outstanding messages to 16 (32KB) messages
  - Since each datagram is a distinct message you end up with a 512KB outstanding data limit
  - You can increase both the number of outstanding messages ('-R') and the size of the message ('-B') from the command line though
- Sample command:
  - `sftp -R 512 -B 262144 user@host:/path/to/file outfile`

# GridFTP

## Open Grid Forum

Community of users  
and vendors

**GridFTP  
Working group**

**GridFTP  
Protocol**

## Globus Toolkit

A specific implementation  
of GridFTP Protocol

# GridFTP

- **GridFTP from ANL has everything needed to fill the network pipe**
  - Buffer Tuning
  - Parallel Streams
- **Supports multiple authentication options**
  - Anonymous
  - X.509 (Personal certificates)
- **Ability to define a range of data ports**
  - helpful to get through firewalls
- **Sample Use:**
  - `globus-url-copy -p 4 sshftp://data.lbl.gov/home/mydata/myfile  
file://home/mydir/myfile`
- Available from: <http://www.globus.org/toolkit/downloads/>

# GridFTP new features

- ssh authentication option
  - Not all users need or want to deal with X.509 certificates
  - Solution: Use SSH for Control Channel
    - Data channel remains as is, so performance is the same
- Optimizations for small files
  - Concurrency option (-cc)
    - establishes multiple control channel connections and transfer multiple files simultaneously
    - Pipelining option:
      - Client sends next request before the current completes
  - Cached Data channel connections
    - Reuse established data channels (Mode E)
    - No additional TCP or GSI connect overhead
- Support for UDT protocol

# GridFTP

The Globus Toolkit provides a GridFTP client called `globus-url-copy`, a command line interface, suitable for scripting.

For example, the following command:

```
globus-url-copy  
gsiftp://remote.host.edu/path/to/file  
file:///path/on/local/host
```

# GridFTP

## Basic command

```
globus-url-copy -vb -p 4 source_url  
destination_url
```

where:

### **-vb**

specifies verbose mode and displays:

- number of bytes transferred,
- performance since the last update (currently every 5 seconds), and
- average performance for the whole transfer.

### **-p**

Specifies the number of parallel data connections that should be used. This is one of the most commonly used options.

# GridFTP

## More options...

```
globus-url-copy -vb -p 4 -r -cd - cc 4 source_url  
destination_url
```

where:

- cc** Specifies the number of concurrent FTP connections to use for multiple transfers.
- cd** Creates destination directories, **if needed**.
- r** Copies files in subdirectories.

The source/destination URLs will normally be one of the following:

- `file:///path/to/my/file`

if you are accessing a file on a file system accessible by the host on which you are running your client.

- `gsiftp://hostname/path/to/remote/file` if you are accessing a file from a GridFTP server

# GridFTP: third Party Transfer

```
globus-url-copy -vb -p 4  
gsiftp://other.machine.my.edu/tmp/foo  
gsiftp://remote.machine.my.edu/tmp/bar
```

# GridFTP

## Failures and retries

```
#!/bin/sh
STATEFILE=/path/to/statefile;
while [ ! -e $STATEFILE -o -s $STATEFILE ];
do
globus-url-copy -rst -p 4 -cc 4 -cd -vb -r -df
$STATEFILE gsiftp://srchost/srcdirpath/
gsiftp://dsthost/dstdirpath/;
sleep 10;
done;
```

# GridFTP

## Load Balancing

```
globus-url-copy -cc 4 -af /tmp/alias-file -f  
/tmp/xfer-file
```

Contents of /tmp/alias-file look something like this:

```
@source  
gridftp1.source-cluster.org  
gridftp2.source-cluster.org  
@destination  
gridftp1.destination-cluster.org  
gridftp2.destination-cluster.org  
gridftp3.destination-cluster.org  
gridftp4.destination-cluster.org
```

Contents of /tmp/xfer-file look something like this:

```
gsiftp:///tmp/x1 gsiftp:///tmp/x1  
gsiftp:///tmp/x2 gsiftp:///tmp/x2  
gsiftp:///tmp/x3 gsiftp:///tmp/x3  
gsiftp:///tmp/x4 gsiftp:///tmp/x4
```

# GridFTP

## Load Balancing

```
globus-url-copy -cc 4 -af /tmp/alias-file -f  
/tmp/xfer-file
```

```
gsiftp://gridftp1.source-cluster.org/tmp/x1 gsiftp://gridftp1.destination-cluster.org/tmp/x1  
gsiftp://gridftp2.source-cluster.org/tmp/x2 gsiftp://gridftp2.destination-cluster.org/tmp/x2  
gsiftp://gridftp1.source-cluster.org/tmp/x3 gsiftp://gridftp3.destination-cluster.org/tmp/x3  
gsiftp://gridftp2.source-cluster.org/tmp/x4 gsiftp://gridftp4.destination-cluster.org/tmp/x4
```

# Globus OnLine Service

Screenshot of the Globus OnLine Service interface. The browser address bar shows <https://www.globusonline.org/xfer/StartTransfer>. The page title is "globus online". The navigation bar includes "Go To: Start Transfer" and "mcarpene Sign Out".

The main section is titled "Transfer Files -" with a dropdown menu set to "source overwrites files on destination". A "View Transfer Activity" link is visible.

Two panels are shown for file selection:

- Left Panel:** Endpoint: `mcarpene#pdl`, Path: `/~/`. The file list includes folders like "Documenti", "GSI-SSHTerm\_IGE\_for\_PRACE\_DGRID\_LRZ-v1.3.2", "Immagini", "Modelli", "Musica", "Scaricati", "Scrivania", "Ubuntu One", "Video", "VirtualBox VMs", "globusconnect-1.4", "rpmbuild", "workspace", and files like "GSI-SSHTerm\_IGE\_for\_PRACE\_DGRID\_LRZ-v1.3.2.zip" (7.28MB), "examples.desktop" (179b), "getskype-linux-beta-ubuntu-64" (22.5MB), "globusconnect-latest.tgz" (7.91MB), and "skype\_2.2.0.35-0natty1\_amd64.deb" (22.49MB).
- Right Panel:** Endpoint: `mcarpene#PLX`, Path: `/~/../..`. The file list includes folders like "asdata", "cineca", "prod", "user\_test", "useragip", "userbmwor", "usercorsi", "userdeisa", "userdompe", "userexternal", "userfercfd", "userforfait", "userfranc", "usergrant", "userhpe", "userhyper", "userinaf", "userincm", "userinternal", and "userjrc".

At the bottom, there is a "Label This Transfer" section with a text input field and a note: "This will be displayed in your transfer activity." A "Get Globus Connect" link is also present with a description: "Turn your computer into an endpoint. The easiest and most convenient way to send and receive files on your machine."

<http://www.globusonline.org>

# GridFTP bottleneck detector

- new command line option for globus-url-copy, "-nlb"
  - nlb = NetLogger bottleneck
  - Uses NetLogger libraries for analysis of network and disk I/O
    - <http://acs.lbl.gov/NetLogger>
- Possible "Bottleneck:" results are:
  - network: somewhere in the network
  - disk read: sender's disk
  - disk write: receiver's disk
  - unknown: disk/network are about the same and/or highly variable

# GridFTP bottleneck detector (cont.)

- **Sample Output:**
  - Total instantaneous throughput:
    - disk read = 1235.7 Mbits/s
    - disk write = 2773.0 Mbits/s
    - net read = 836.3 Mbits/s
    - net write = 1011.7 Mbits/s
  - **Bottleneck: network**
- Ignore the "net write" value (strongly influenced by system and TCP buffer artifacts)
- ***instantaneous throughput is the average # of bytes divided by the time spent blocking on the system call***
- ***instantaneous throughputs are higher than the overall throughput of the transfer:***
  - does not include the time waiting for data to be available
  - primarily useful for comparison and not as absolute numbers

# Sample Data Transfer Results

- Using the right tool is very important
- Sample Results:
  - RTT = 53 ms, network capacity = 10Gb/s.
- **Tool Throughput**
  - **scp**: 140 Mb/s
  - **HPN patched scp**: 1.2 Gb/s
  - **FTP**: 1.4 Gb/s
  - **GridFTP**, 4 streams 5.4 Gb/s
  - **GridFTP**, 8 streams 6.6 Gb/s

## Other tools

- **bbcp:** <http://www.slac.stanford.edu/~abh/bbcp/>
  - supports parallel transfers and socket tuning
  - `bbcp -P 4 -v -w 2M myfile remotehost:filename`
- **lftp:** <http://lftp.yar.ru/>
  - parallel file transfer, socket tuning, HTTP transfers, and more.
  - `lftp -e 'set net:socket-buffer 4000000; pget -n 4 [http|ftp]://site/path/file; quit'`
- **axel:** <http://axel.alioth.debian.org/>
  - simple parallel accelerator for HTTP and FTP.
  - `axel -n 4 [http|ftp]://site/file`
- **rsync:** <http://rsync.samba.org/>
  - `rsync --timeout=600 -avHS -r --numeric-ids --bwlimit=80000 --block-size=1048576 --progress $CINECA_SCRATCH/path/file $CINECA_DATA/path/`

## Improvements in performance

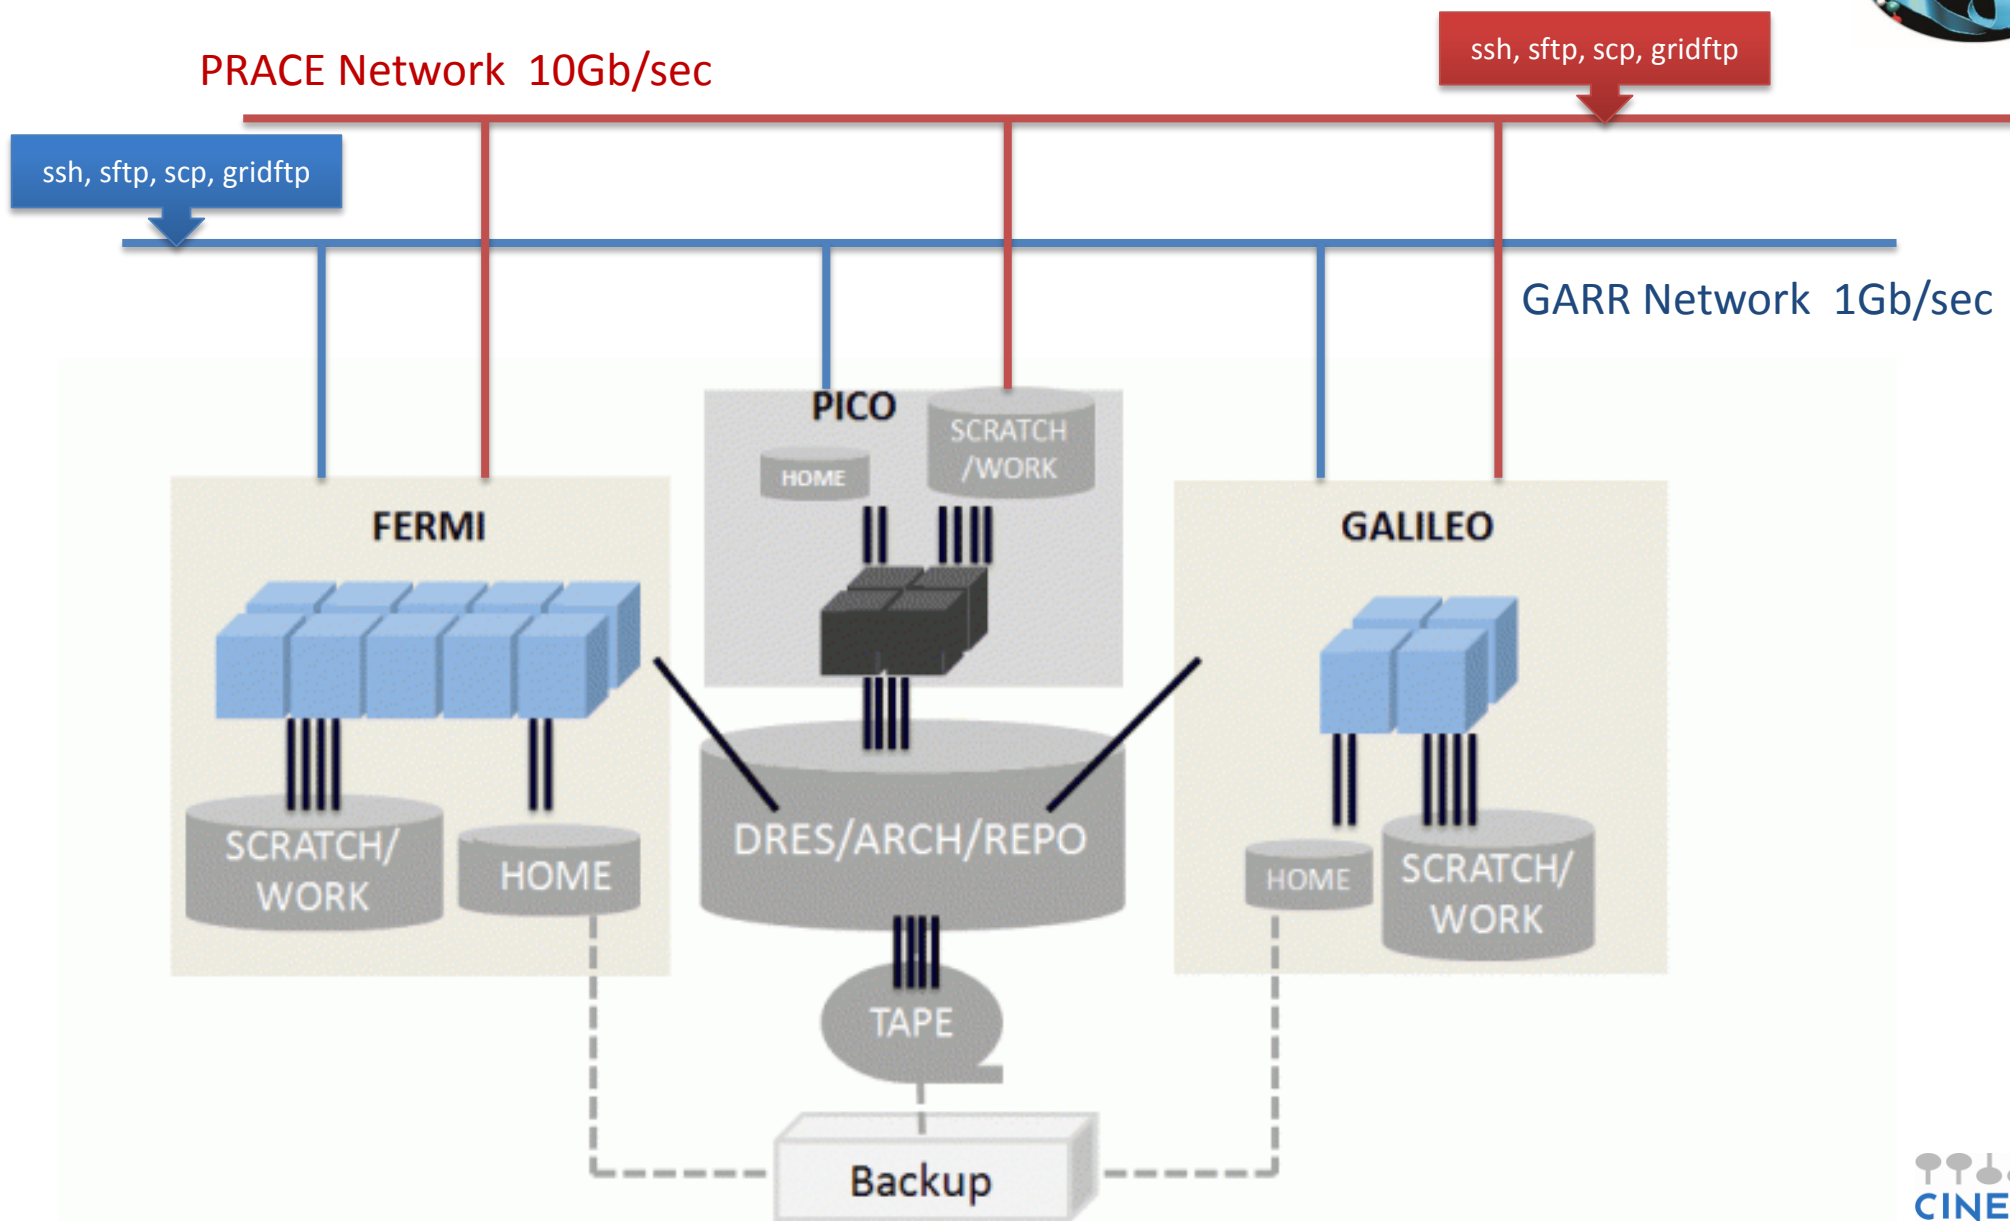

# Network resources

- The clusters are reachable from the public network through GARR (Italian NREN) facility (1Gb/s)
- The PRACE infrastructure has a dedicated private network which provides 10Gb/s guaranteed bandwidth (available on FERMI)

# CINECA data resources

# CINECA “cindata” command

- What’s about storage’s status?

```
-bash-3.2$ cindata
```

# Bulk Data Transfer Summary

- **TCP tuning is critical, but is now easy**
  - Four lines in /etc/sysctl.conf to give autotuning
  - Make sure you're not stuck with TCP Reno
- **Build one host for WAN data transfers, make sure it's right**
  - Make sure TCP parameters are configured
- **Plug your hosts into the right place in the network**
- **Use the right tools**
  - Parallelism is a key
  - GridFTP, BBCP, HPN-SSH
