- **Introduction**
  - Context
- **Getting started**
  - Compiling the code
  - Input: Constant velocity
  - Input: Linear Velocity (map)
- **Testing**
  - 5 layer case: output comparison
  - Debugging: Totalview
  - Hypothesis: variable reference?
- **Perspectives**

Parade:

- **Model Builder**
- Ray Tracer
- Output Reader

SS and SB are horizons, a layer has specific velocity attributes defined by a map or a constant value.

Tetrahedrons are build in the layer between horizons: a ray is traced from one horizon to another through the tetrahedrons.

The ray will be divided into segments with their own length and velocities depending from the input velocities.

A first bug in the model builder has been fixed and the code works for a single layer case.  
(A wrong variable reference in the file mmsCurvilinearMeshedModelBuilder.cpp)

For  $n_{layer} > 1$ , the results obtained with a constant velocity and a map of constant velocity are not consistent.

# Compiling Parade

The code have been compiled on PLX machine.

Configure arguments:

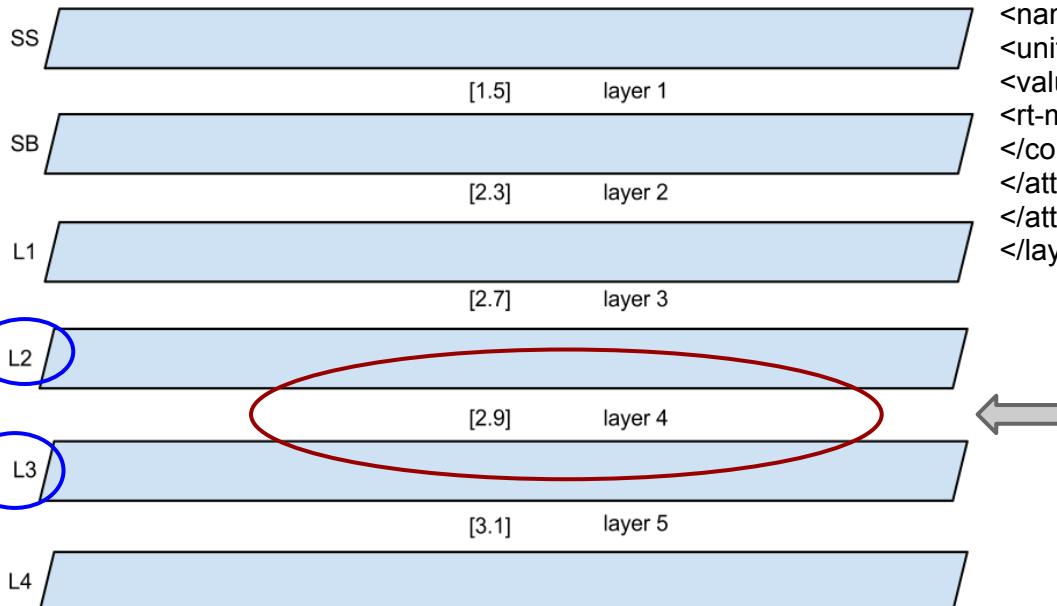

```
./configure --with-mode=dbg --with-cxx=g++ --with-w64 --with-lib64 --with-stl --enable-shared --with-thread --with-ogl --with-x --with-python --with-pio --with-rt --with-spatialindex
```

Remarks:

- OK with gnu C++ compiler v. 4.1.2 or older.
- Error with gnu C++ compiler v. 4.4.6 or newer: an include has to be modified ( ).
- To compile on eni0x and on PLX "tk" support should be disabled (tk libraries are too recent)

## simple case - constant velocity:

- Define 6 horizons: SS, SB, L1, L2, L3, L4
- Define 5 Layers (regions between horizons)
- Each layer is defined by 2 horizons
- For each layer a **constant velocity** is given

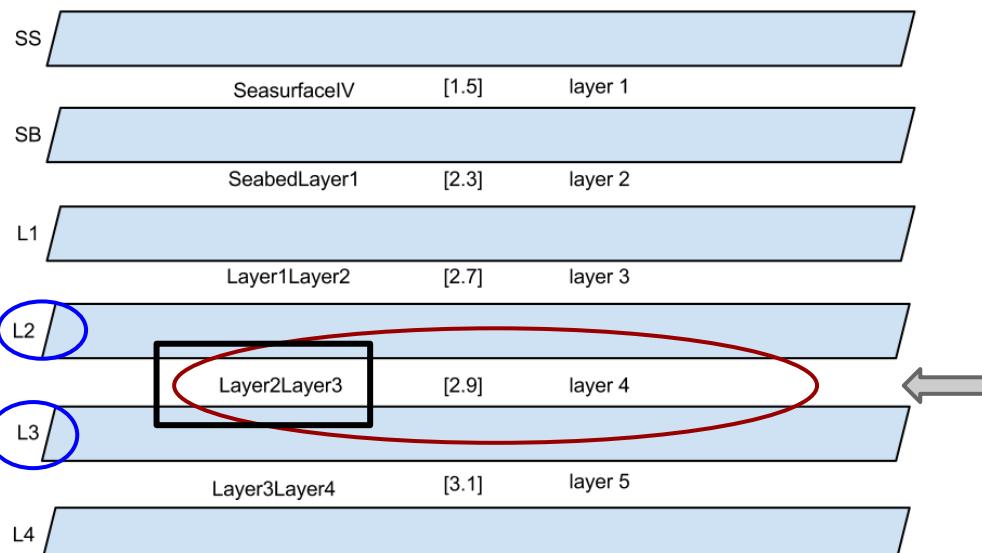

## Layer definition example:

```
<layer>
<name>layer4</name>
<id>4</id>
<top-surface>L2</top-surface>
<base-surface>L3</base-surface>
<attributes>
<attribute>
<constant-attribute>
<name>P Velocity</name>
<unit>km/s</unit>
<value>2.9</value>
<rt-model-velocity-type>velocity</rt-model-velocity-type>
</constant-attribute>
</attribute>
</attributes>
</layer>
```

Constant velocity tracer  
is employed by default

## complex case - linear velocity:

- Define 6 horizons: SS, SB, L1, L2, L3, L4
- Define 5 Layers (regions between horizons)
- Each layer is defined by 2 horizons
- **Define a top surface velocity for the top horizon of the layer and a bottom surface velocity for the bottom horizon of the layer**

## Layer definition example:

```

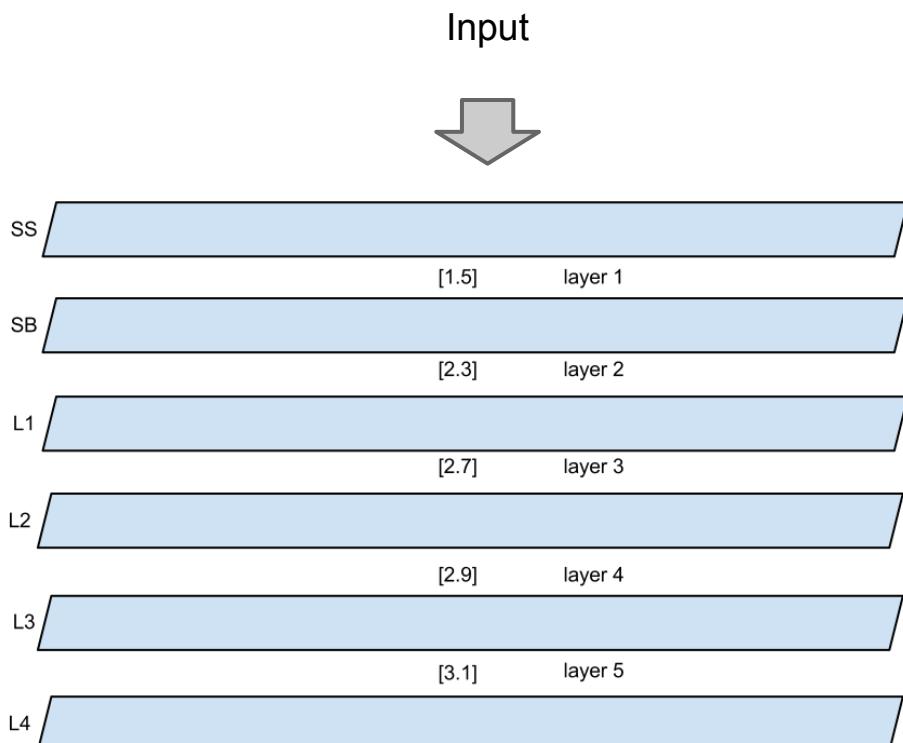

<layer>
<name>layer4</name>
<id>4</id>
<top-surface>L2</top-surface>
<base-surface>L3</base-surface>
<division>1</division>
<attributes>
<attribute>
<variable-attribute>
<name>P Velocity</name>
<unit>km/s</unit>
<top-surf-attr-file>layer2layer3IV.zyc</top-surf-attr-file>
<base-surf-attr-file>layer2layer3IV.zyc</base-surf-attr-file>
<rt-model-velocity-type>linear-velocity</rt-model-velocity-type>
</variable-attribute>
</attribute>
</attributes>
</layer>

```

Function: ComputeTetraVelFunction  
(Recompute linear velocity function coefficients)

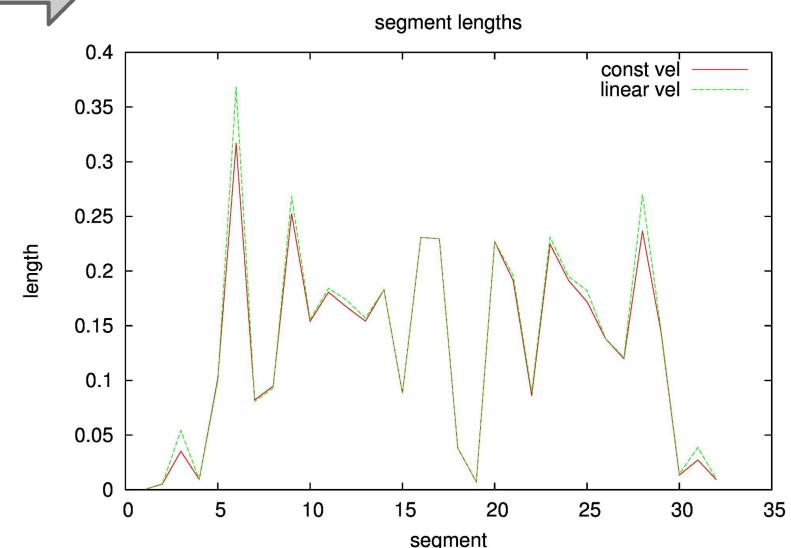

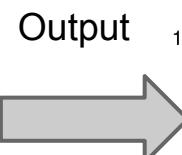

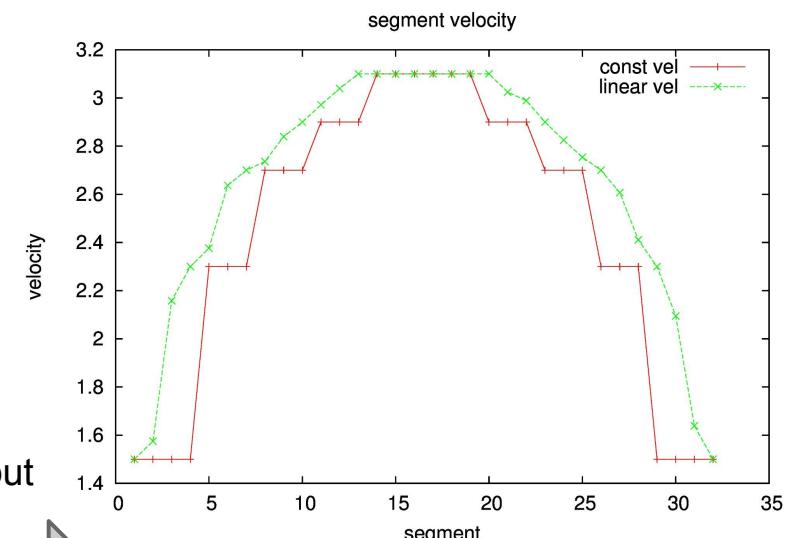

IF NO GRADIENT IS FOUND  
FOR A TETRA ELEMENT  
--> back to constant velocity tracer

# Test case: different output

Linear velocities case:  
Function: ComputeTetraVelFunction  
(Recompute linear velocity function coefficients)

A GRADIENT IS FOUND FOR TETRA ELEMENTS

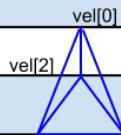

# Debugging: Totalview

</layer>

```

Horizon L1 keeps the last velocity defined (as top surface of layer 3).

The tetrahedron vertices assume different values along z --> a gradient is found

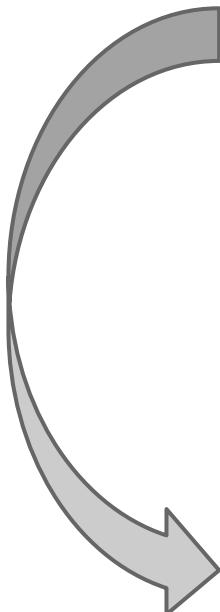

Output velocities are distributed as a gradient

- Hands on the code:
  - **check the first bug-fix**
  - **verify analogies** with other parts of the source code  
(same variable references to be modified?)

# A step back: bug report

mmsCurvilinearMeshedLayerModelBuilder.C have been modified.

```
basArray1DNumeric& samples=attr->getAttributeSample(ix,iy,nz1);
samples[1]=s1[2];
```

```
samples=attr->getAttributeSample(ix,iy,nz2);
mesh.getCoordinates(ix,iy,nz2,p);
samples[0]=s2[2];
```

```
basArray1DNumeric& samples1=attr->getAttributeSample(ix,iy,nz1);
samples1[1]=s1[2];
```

```
basArray1DNumeric& samples2=attr->getAttributeSample(ix,iy,nz2);
samples2[0]=s2[2];
```

**Is it possible that the same variable is defined somewhere else in the code?**
