

# PARADE

# Debugging

# Problem description

## Constant velocity

Define 6 horizons:  $SS, SB, L1, L2, L3, L4$

- Define 5 Layers (regions between horizons)
- Each layer is defined by 2 horizons
- For each layer a **constant velocity** is given

## Problem:

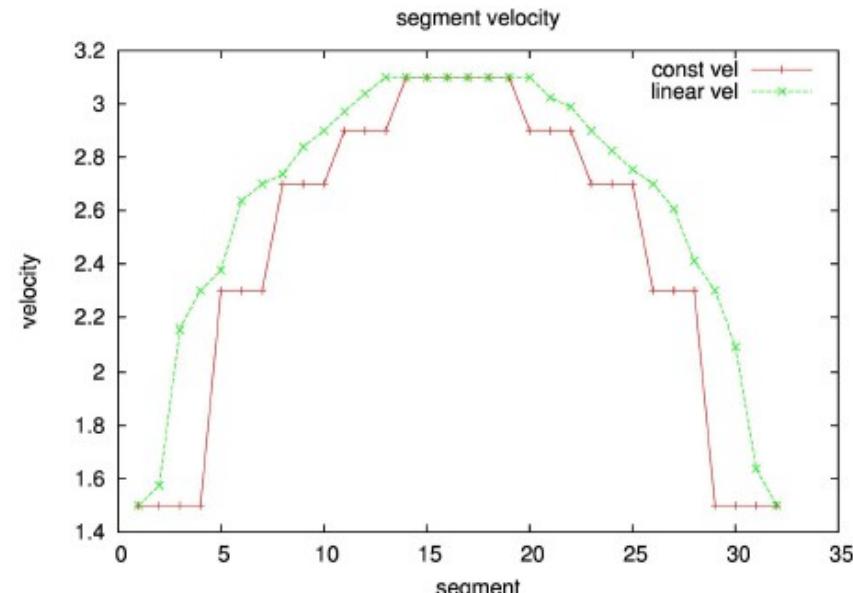

A velocity gradient is found for each tetra element in the model.

----> Recompute linear velocity function coefficients

## Linear Velocity

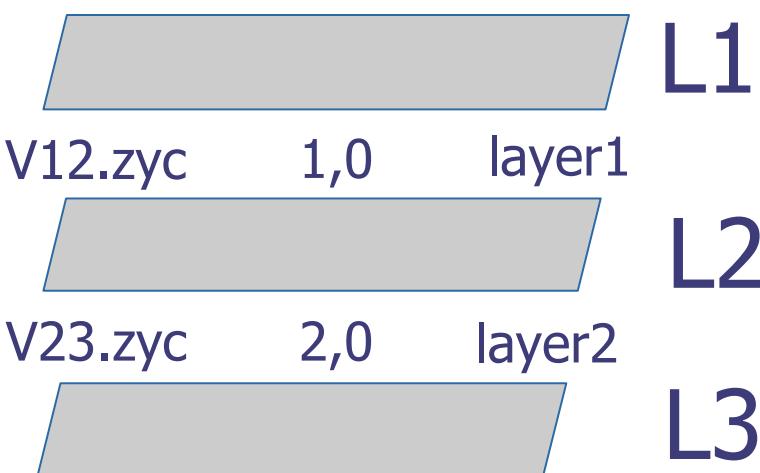

Define 6 horizons:  $SS, SB, L1, L2, L3, L4$

- Define 5 Layers (regions between horizons)
- Each layer is defined by 2 horizons
- Define a **top surface velocity** for the top horizon of the layer and a **bottom surface velocity** for the bottom horizon of the layer

# Case Configuration

## Linear velocity

```
<layers>
<layer>
<name>layer1</name>
<id>1</id>
<top-surface>L1</top-surface>
<base-surface>L2</base-surface>
<division>1</division>
<attributes>
<attribute>
<variable-attribute>
<name>P Velocity</name>
<unit>km/s</unit>
<top-surface-attribute-file>V12.zyc</top-surface-attribute-file>

</variable-attribute>
</attribute>
</attributes>
</layer>
</layers>
```

# computeTetraVelFunction

## File rtLinearVelModel.C:

```

void rtLinearVelModel::computeTetraVelFunction(int tetra_id, int layer_flag, const
basArray1D<cgcPoint>& node_coords, const mmsNonStrucAttribute<double>* pvels) {
    //get the tetra element
    const rtTetra& tetra=d_mesh->getTetra(tetra_id);
    double vel[4];
    for(int i=0; i<4; ++i) {
        const rtSurfacePointAttribute *attr=d_surfaceset->getVertexAttribute(tetra.getNodeId(i))

if( attr ) { //node is on the surface
    if(this->getSurfaceSet()->getLayerIDPointedByNormal(tetra.getNodeId(i))<=0) {
        vel[i]=attr->getPVelocityTop();
    } else {
        if(this-
>getSurfaceSet()->getLayerIDPointedByNormal(tetra.getNodeId(i))==tetra.getLayerId()) {
            vel[i]=attr->getPVelocityTop();
        }
        else {
            vel[i]=attr->getPVelocityBot();
        }
    }
}
else { //node is not on the surface
    vel[i]=(*pvels)[tetra.getNodeId(i)];
}
}

```

**Never executed!**

# computeTetraVelFunction

computeTetraVelFunction gets vertex attributes for all vertex on geological surface

```
const rtSurfacePointAttribute *attr=d_surfaceset->  
getVertexAttribute(tetra.getNodeId(i));  
  
if( attr ) { //node is on the surface  
...  
}
```

??

attr is always equal to NULL pointer, why??

computeTetraVelFunction is called before setting vertex attributes

Let's take a look to source code...

# computeTetraVelFunction

## File rtLayerModelBuilder.C:

```
void rtLayerModelBuilder::setModelAttributes (mmsLayerModelBuilder& builder) {  
...  
...  
    d_model_p->setAttribute(rt_attrs);  
#ifdef DEBUG  
    cout<<"Set attributes for all surface points of curvilinear tetra  
model"<<endl;  
#endif  
    if(attr_type!=mmsAttribute::CELL_TYPE) {  
        rtSurfaceSet *surf_set=(rtSurfaceSet*) (d_model_p->getSurfaceSet());  
        rtSurfacePointAttribute pa;  
        //now set attributes for those vertices located on the surface  
        ...  
        ...  
        if(flag&&surf_set->getVertexNormal(i)) {  
            const basArray1DNumeric<double>& pvels=vel->getAttributeSample(i);  
            pa.setPVelocityTop(pvels[0]);  
            pa.setPVelocityBot(pvels[pvels.size()-1]);  
            ...  
            ...  
            surf_set->addVertexAttribute(i, pa);  
        }  
    }  
}
```

1

2

# computeTetraVelFunction

## File rtLinearVelModel.h:

```
virtual void setAttribute(rtAttribute<double>* attribute) {  
    d_attribute=attribute;  
    if(d_attribute->getVelocityType() !=rtVelocityType::LINEAR_VELOCITY)  
throw rtException("inconsistent velocity type between model and  
attribute");  
    if(d_attribute->getPVelocityAttribute()->getAttrType() !=  
mmsAttribute::NODE_TYPE) {  
        throw rtException("Mesh attribute type must be node type",  
rtException::INVALID_ATTRIBUTE_TYPE);  
    }  
    //computer linear function velocity function for each tetra  
elements of the mesh  
    this->computeTetraVelFunctions();  
}
```

1

Vertex attributes have not yet been initialized!!

Let us modify the source code

# computeTetraVelFunction

## File rtLinearVelModel.h:

```
virtual void setAttribute(rtAttribute<double>* attribute) {
    d_attribute=attribute;
    if(d_attribute->getVelocityType() !=rtVelocityType::LINEAR_VELOCITY) throw
rtException("inconsistent velocity type between model and attribute");
    if(d_attribute->getPVelocityAttribute()->getAttrType() !=
=mmsAttribute::NODE_TYPE) {
        throw rtException("Mesh attribute type must be node type",
rtException::INVALID_ATTRIBUTE_TYPE);
    }
    this->computeTetraVelFunctions();
}
```

Remove computeTetraVelFunction calling from setAttribute function

# computeTetraVelFunction

## File rtLayerModelBuilder.C:

```
void rtLayerModelBuilder::setModelAttributes (mmsLayerModelBuilder& builder)
{
...
...
d_model_p->setAttribute(rt_attrs);

#ifndef DEBUG
cout<<"Set attributes for all surface points of curvilinear tetra
model"<<endl;
#endif

if(attr_type!=mmsAttribute::CELL_TYPE) {
    rtSurfaceSet *surf_set=(rtSurfaceSet*) (d_model_p->getSurfaceSet());
    rtSurfacePointAttribute pa;
    //now set attributes for those vertices located on the surface
    ...
    ...

if(flag&&surf_set->getVertexNormal(i)) {
    const basArray1DNumeric<double>& pvels=vel->getAttributeSample(i);
    pa.setPVelocityTop(pvels[0]);
    pa.setPVelocityBot(pvels[pvels.size()-1]);
    ...
    surf_set->addVertexAttribute(i, pa); 
    d_model_p->computeTetraVelFunctions();
}
```

Insert computeTetraVelFunction calling after addVertexAttribute function

# computeTetraVelFunction

## File rtLinearVelModel.C:

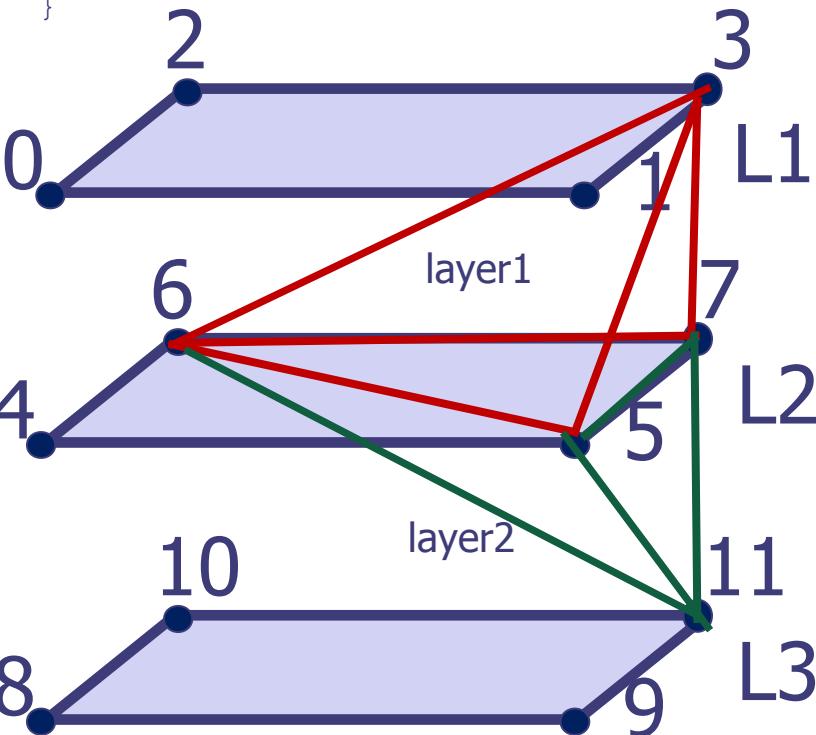

```
void rtLinearVelModel::computeTetraVelFunction(int tetra_id, int layer_flag, const  
basArray1D<cgcPoint>& node_coords, const mmsNonStrucAttribute<double>* pvels) {  
    //get the tetra element  
    const rtTetra& tetra=d_mesh->getTetra(tetra_id);  
    double vel[4];  
    for(int i=0; i<4; ++i) {  
        const rtSurfacePointAttribute *attr=d_surfaceset-  
>getVertexAttribute(tetra.getNodeId(i));  
        if( attr ) { //node is on the surface  
            if(this->getSurfaceSet()->getLayerIDPointedByNormal(tetra.getNodeId(i))<=0) {  
                vel[i]=attr->getPVelocityTop();  
            } else {  
                if(this->getSurfaceSet()-  
>getLayerIDPointedByNormal(tetra.getNodeId(i))==tetra.getLayerId()) {  
                    vel[i]=attr->getPVelocityTop();  
                }  
            }  
            else vel[i]=attr->getPVelocityBot();  
        }  
    }  
    else { //node is not on the surface  
        vel[i]=(*pvels)[tetra.getNodeId(i)];  
    }  
}
```

**Correctly executed!  
attr is not NULL pointer  
now**

# Surface Vertex Attribute

Linear velocity function coefficients are now computed in the right way but surface vertex attributes are not set correctly...

```
void rtLayerModelBuilder::setModelAttributes (mmsLayerModelBuilder& builder) {
...
surf_set->addVertexAttribute(i, pa);
cout<<"Vertex Attribute for vertex "<<i<<" is "<<*(surf_set->getVertexAttribute(i))<<endl;
}
```

Vertex Attribute for vertex **3** is  
p-velocity on the top of surface:1  
p-velocity on the bottom of surface: 1

Vertex Attribute for vertex **5** is  
p-velocity on the top of surface:2  
p-velocity on the bottom of surface: 2

Vertex Attribute for vertex **6** is  
p-velocity on the top of surface:2  
p-velocity on the bottom of surface: 2

Problem with normals of surface vertex ...

# Test Case

CASE NAME	SURFACE SIZE	#Layer	Division factor
SMALL	2X2	2	2

# Test Case Debugging with Totalview

# Test Case Debugging with Totalview

Top and bottom vertex velocities: **OK**

Normals of surface vertex: **KO**

The image shows two separate windows of the Totalview debugger. Both windows have a title bar with the path: /gpfs/scratch/userinternal/ainverni/MMT/swamp/MMT-BUG/swamp\_4.1.2\_Work... and a menu bar with File, Edit, View, Window, Help, and a dropdown showing '1.1'.

**Top Window (Normal Values):**

Expression	Value
tetra.getNodeId(i)	0x00000006 (6)
attr->getPVelocityTop()	1
attr->getPVelocityBot()	1
this->getSurfaceSet()->getLayerIDPointedByNormal(tetra.getNodeId(i))	0x00000001 (1)
tetra.getLayerId()	0x00000001 (1)

**Bottom Window (Normal Values):**

Expression	Value
tetra.getNodeId(i)	0x0000000a (10)
attr->getPVelocityTop()	1
attr->getPVelocityBot()	2
this->getSurfaceSet()->getLayerIDPointedByNormal(tetra.getNodeId(i))	0x00000002 (2)
tetra.getLayerId()	0x00000001 (1)

A red rectangular box highlights the last two rows of the bottom window's table, specifically the 'this->getSurfaceSet()->getLayerIDPointedByNormal(tetra.getNodeId(i))' and 'tetra.getLayerId()' entries.
